Surgery Authorization & Consent

Owner's Name: _____ Pet's Name: _____

Address: _____ Species: _____

Because your pet will have a general anesthetic, the doctors at Fremont Veterinary Clinic recommend that a Pre-Anesthetic Blood screen be performed. This test helps determine if underlying diseases exist which might add risk to your pet's procedure. While this test is required for all cats and dogs over 7 years of age it is helpful for all pets. (Please initial below).

Yes, please perform a Pre-Anesthetic blood Test on my younger pet. _____ (initial)

No, do not perform a Pre-Anesthetic Blood Test on my younger pet. _____ (initial)

I am the owner or agent of the above pet and have the authority to sign this consent. By signing this, I authorize the following procedure(s) on my pet:

I authorize the use of appropriate anesthetics and other medications, and I understand that hospital support personnel will be assisting in my pet's care.

I understand that during anesthesia, emergency or unforeseen conditions may make it necessary for the doctor to perform additional or different procedure(s) that are in my pet's best interest. I therefore authorize these emergency procedures until I can be contacted.

I have been advised as to the nature of the procedure(s) and the risks involved. My questions have been answered to my satisfaction and I realize that results cannot be guaranteed. I have read and understand this authorization and consent.

Avid Chip:

Now is a good time for you to consider an Avid Chip for your pet. This is a rice-sized microchip, which can greatly aid in identifying your pet should he or she get lost. The microchip is inserted under the skin between the shoulder blades and is a permanent way to help insure that your pets are returned to you if they are missing. (Please initial below)

Yes, I want a microchip for my pet. _____ (initial)

No, I do not want a microchip for my pet. _____ (initial)

Hip Dysplasia Check:

This is also a good time to check the hips of larger breed dogs (40 lbs. and over) for evidence of Hip Dysplasia. Hip Dysplasia is a laxity of the hips that is found early on in young dogs. It often results in debilitating arthritis later in life. Manipulating the hips and a screening X-ray are good ways to check early on for this condition. Because such diagnostics require anesthesia, now is a good time to take hip X-rays while your dog is already anesthetized. (Please initial below)

Yes, Please X-ray my dog for Hip Dysplasia if the doctor finds it necessary. _____ (initial)

No, do not X-ray my dog. _____ (initial)
